

SUPER TACK

LIQUID BITUMEN

PROUDLY
SOUTH AFRICAN

LIQUID BITUMEN

Application

Overview:

Super Tack is a thin layer of asphalt emulsion applied to an existing or prepared surface before a new asphalt layer is laid. Its primary purpose is to create a strong, adhesive bond between the layers, acting like glue to prevent slippage and delamination, which are common pavement failures. By ensuring the layers act as a single, cohesive unit, the tack coat provides structural integrity, increases load capacity, and extends the pavement's lifespan.

Direction of use:

Shake the container to ensure that the product is homogenous.

Prepare the area by **removing** all loose debris. Then, apply a thin, uniform layer of the tack coat with a **brush or soft broom** to the entire exposed surface of the pothole, ensuring good coverage of the **sides and bottom**.

Ensure that the product is spread evenly with no **puddles** remaining.

Apply at a rate of 0.7 – 1 Liter/m² depending on the surface to be treated **but not more** than 1 Liter/m².

Allow the tack coat to dry.

When applied the appearance will be **light brown** and will turn **black** when dry.

When dry your **asphalt** can be added. **Compact** the new material and finish the patch.

Clean equipment with water immediately after use.
